

(a) Strategic Decision Matrix: Macro Production Loss vs Micro Livelihood Impact Rate
Categorizing East Java Districts across 4 Policy Intervention Quadrants

(b) Severity Rank Inversion Analysis: Absolute Volume vs Local Sawah Damage Rate
Pacitan Inverts from #3 to #1 (+2 Ranks), while Lamongan Shifts from #1 to #4 (-3 Ranks)

(c) Inter-Regional Equity Metric: Location Quotient (LQ) Benchmark against Provincial Mean
Pacitan Sustains 11.90x the Provincial Average Damage Intensity, Followed by Tulungagung (4.59x) & Gresik (4.32x)

Tier 1: Absolute Volume (Macro)

Measures the aggregate statewide grain deficit. Indispensable for the Governor, Dinas Pertanian, and Bulog to calculate total lost rice production (41,576 ha total), emergency seed replenishment, and grain market stabilization. Dominated by Lamongan (12,997 ha) and Gresik (6,008 ha).

Tier 2: Local Sawah Rate (Micro)

Measures the intensity of agrarian livelihood destruction relative to the local agricultural asset base. Crucial for Regents and social services: Pacitan lost 43.4% of its entire sawah base in Jan 2024 MT-1, representing a severe food crisis for smallholders, despite lower aggregate hectares.

Tier 3: Provincial LQ (Equity)

Evaluates whether a district suffered disproportionately compared to the provincial mean (3.65% loss rate). Pacitan displays an extreme Location Quotient of 11.90x, followed by Tulungagung (4.59x) and Gresik (4.32x), proving that small agrarian enclaves experience extreme localized desiccation shocks.

Actionable BTT Allocation Policy

Recommends an equitable dual-formula for provincial emergency funds (Belanja Tidak Terduga / BTT): 60% allocated proportionally to Absolute Loss (securing regional food supply), and 40% allocated proportionally to Location Quotient (protecting smallholder farmer livelihood survival in pockets like Pacitan).
